Controlled Visibility

The focus of the system is the variability in its level of transparency; through different portions having more of less visibility than the other. While the viewer is not able to completely change their positioning, their height will determine the clarity with which they are able to view inside. The portion at the top provides full visual contact V(100), however, as the viewer looks below the portion at the bottom increases it's opacity, decreasing the visual contact, V(25), allowing the viewer to see less internally. This allows for a varying level of privacy within the element.
