Split Bearings

This System focuses on the junction between two mediums, public to private. The two areas are split off with the main focus on the centre area as if the two areas are not connected, there is no access. This system is not fixed and has a bridging aspect, hence the two areas connecting, it allows full access from one side to the other. C is completely separated from P by X, however when the arrow line connects, C has full access to P through X and vice versa.

LAURA AND DYLAN - / CATALOGUE 2

s

This system connects two separate domains - public and private - via a central junction. This junction acts as a bridge that enables full access between the two domains, allowing users on both sides to share information and collaborate. Without the junction, there would be no way for the two domains to communicate with each other. The arrow line that connects the two domains represents the access that is granted through the central junction, enabling communication and collaboration between them.
