

Vertical Classification

Verticality is often a neglected space of use that proves beneficial in the element chosen. With an open Vertical unhindered space, the elevation of the area is divided into different levels each with a particular use. The top part, Area 1, used to hang the lights for maximum area coverage and plants for optimal exposure to light and access to O2 and CO2. The middle part, Area 2, is cleared as a space of air flow and people's breathing and circulation. Lastly, Area 3 is closest to the ground and is a space that is logically filled with the needed furniture.
