CONTROLLED SEGREGATION

The focus of the system provides occupants the ability to travel in and out of a building, particularly those experiencing a high volume of people entering and exiting. They relieve immense pressure caused by air rushing through high-rise buildings, whilst at the same time providing traffic control; as typically only one person can use each quadrant at a time. The rotating, sectioned nature of the revolving door segregates users into each quadrant providing them a split second of peaceful time alone in an environment that otherwise feels fast-paced and crowded.
