DIAGRAM

CROSSING THE LINE

The existing condition (c) remains unchanged unless crossing the threshold (t). If this occurs, the orientation is changed, creating a new condition (b).

#### SYSTEM RE-IMAGINATION

This interpretation of the system takes the change in orientation offered by (b) and uses it to justify the change in orientation between a vertical stool leg (c), and its horizontal seat.

Given that this system occurs four times, this was replicated to create four stool legs.

The stool is submerged in water, to provide it with the necessary threshold (t) to alert the stool legs to begin their transition.
