CONVERGING ENTRIES

The focus of this system is the ways in which spaces transition into each other. As shown in the diagram there are three separate spaces , all of which have a convergence point in the centre (R). This means the spaces while being completley seperate from one another, are still able to share space through the way in which the entrances work. For example while all of the spaces have independant entrance points, they also have entrance/exit points which lead directly into the middle space.
